RÉPARTITION DE LA POPULATION
PAR AGE ET SEXE

INTRODUCTION.

La population belge est répartie au 31 décembre 1947 par années d'âge comme l'indique le tableau 1. Toutefois, en vue de faciliter l'étude de cette distribution, nous considérons généralement dans la suite, la population par groupe d'âges d'une amplitude de cinq ans.

Au sujet de la distribution de la population par âge, une remarque préliminaire s'impose. Les traités de démographie ne manquent jamais de signaler l'attraction aux âges ronds, c'est-à-dire aux âges terminés par 0 ou 5, que l'on constate dans les déclarations des habitants.

En Belgique, de telles erreurs sont actuellement impossibles. On les a toutefois enregistrées dans le passé, notamment lors du recensement de 1846.

La question posée dans le bulletin individuel ne demande pas l'âge mais bien la date de naissance (année, mois, jour).

Ce recensement est contrôlé par les agents recenseurs au moyen, soit des registres de population, soit de la carte d'identité dont les habitants âgés de 15 ans et plus doivent être porteurs en vertu de l'arrêté royal du 6 février 1919 pour les Belges et de l'arrêté-loi du 14 août 1933 pour les étrangers, soit, le cas échéant, à l'aide de tous autres documents tels les carnets de mariage, passeports, feuilles de route, etc...

Le recensement ayant lieu le 31 décembre à minuit, le relevé de la population par année de naissance donne immédiatement la distribution par âge.

Dans les chiffres suivants on considérera généralement l'âge de tous les habitants du pays, aussi bien ceux de nationalité étrangère que de nationalité belge.

Quand il n'en sera pas ainsi, on l'indiquera clairement.

CHAPITRE I.

RÉPARTITION PAR ÂGE DE L'ENSEMBLE DE LA POPULATION.

1. — Répartition de la population du Royaume par année d'âge.

La population de la Belgique au 31 décembre 1947 se répartit par année d'âge comme il est indiqué dans le tableau 1.

Si l'on fait abstraction des sexes, on constate que le plus grand nombre des habitants est âgé de 1 à moins de 2 ans.

De même, les enfants de moins de 1 an et les personnes âgées de 24 à moins de 25 ans, de 26 à moins de 27 ans et de 27 à moins de 28 ans sont presque aussi nombreux.

Nous aurons d'ailleurs l'occasion de reparler de l'allure de cette distribution, qui est sensiblement la même pour les hommes que pour les femmes, lorsque nous étudierons plus loin la pyramide des âges.

2. — Répartition de la population du Royaume par groupe d'âges.

Le tableau 2 donne, en chiffres absolus et proportionnels, la répartition de la population du Royaume par groupe d'âges pour chacun des recensements qui se sont succédé depuis 1846.

Si l'on considère le recensement de 1947, on constate que le groupe des habitants âgés de 20 à moins de 25 ans est plus important (7.98 % de la population totale); il provient des naissances qui se sont produites au cours des années 1923 à 1927. Vient ensuite le groupe des habitants âgés de 40 à moins de 45 ans (7.76 %), nés au cours des années 1903-1907. Les groupes de 15 à moins de 20 ans et de 35 à moins de 40 ans sont pratiquement égaux et prennent respectivement la troisième et la quatrième place, chacun 76 pour mille.

Le groupe de personnes de moins de 5 ans, nées au cours des années 1943 à 1947 vient seulement à la cinquième place et n'est guère plus nombreux que celui des personnes de 45 à moins de 50 ans, nées entre 1898 et 1902.

Si l'on compare les chiffres de 1947 à ceux de 1930, on constate :

1) que le nombre des habitants de moins de 10 ans est, en 1930, supérieur à celui de 1947;

2) que le nombre des habitants de 10 à moins de 20 ans est, en 1947, supérieur à celui de 1930;

La population belge vieillit. Pour s'en rendre compte, il suffit d'examiner le tableau 3 dans lequel on a donné les proportions pour mille des habitants ayant atteint un âge donné lors de chaque recensement exécuté depuis 1846. D'autre part, l'on a repris, pour la même période,

dans le tableau 4, les proportions des enfants (moins de 15 ans), des adolescents (15 à moins de 21 ans), des adultes (21 à moins de 65 ans) et des vieillards (65 ans et plus) pour mille habitants.

3. — Répartition de la population des provinces par groupe d'âges.

La répartition des habitants des provinces par groupe d'âges est donnée dans le tableau 5.

Les proportions extrêmes sont reprises pour chaque groupe d'âges dans le tableau 6.

Ces tableaux nous montrent que la distribution de la population par âge est fort dissemblable d'une province à l'autre. La différence entre les proportions extrêmes qui est de 47 pour le groupe de moins de cinq ans reste identique pour le groupe suivant; elle passe successive-

ment dans les autres groupes à 45, 29, 22, 10, 6, 11, 18, 27, 29, 27, 24, 21, 17, 10 et 6.

Il est intéressant de se rendre compte de l'intervention de chaque province dans chacun des groupes d'âges; c'est ce qui est fait dans le tableau 7.

Les différences entre les diverses proportions reprises à ce tableau proviennent de trois facteurs :

1) d'une part la régression de la natalité qui n'a pas atteint la même importance dans toutes les provinces;

2) les mouvements migratoires inter-provin-

ciaux dont l'importance est d'autant plus sensible que les provinces qui exercent la plus forte attraction, sont celles dans lesquelles la natalité est la moins élevée;

3) les mouvements d'immigration étrangère qui sont spécialement importants dans les provinces de Hainaut et de Liège.

Dans le tableau 8 on a indiqué pour chaque province les groupes d'âges pour lesquels l'importance relative est inférieure (—), supérieure ou égale (+) à celle qui revient à l'ensemble de la province dans la population du Royaume.

En répartissant les habitants en quatre catégories : enfants (— de 15 ans); adolescents (15 à — de 21 ans); adultes (21 à — de 65 ans); vieillards (65 ans et plus) on obtient les proportions indiquées au tableau 9 pour les années 1930 et 1947.

Par rapport à 1930, il y a diminution de l'importance du nombre des enfants dans toutes les provinces. La proportion des adolescents est, en 1947, supérieure à celle de 1930 dans la province de Limbourg seulement; dans la province de Namur, les proportions de 1930 et 1947 restent identiques. En ce qui concerne les adultes, les différences entre les chiffres sont peu sensibles; il y a augmentation dans toutes les provinces, excepté dans le Brabant, la Flandre orientale et la province de Liège. La proportion des vieillards s'accroît d'une façon sensible dans toutes les provinces.

4. — Répartition de la population des groupes de communes par groupe d'âges.

Le tableau 5 permet de se rendre compte de la distribution par âge de la population des groupes de communes.

Les proportions pour mille les plus élevées des différents groupes d'âges se rencontrent dans les groupes de communes ci-après :

Moins de 25 ans : communes de 2,000 à moins de 5,000 habitants;

25 à moins de 30 ans : communes de 20,000 à moins de 50,000 habitants;

30 à moins de 45 ans : communes de 50,000 à moins de 100,000 habitants;

45 à moins de 75 ans : communes de 100,000 habitants et plus;

75 à moins de 80 ans : proportions égales pour les communes de moins de 2,000 habitants et de 100,000 habitants et plus;

80 ans et plus : communes de moins de 2,000 habitants.

La population des groupes de communes se répartissent proportionnellement en enfants, adolescents, adultes et vieillards comme cela est indiqué au tableau 10.

Les première et seconde catégories — moins de 15 ans et 15 à moins de 21 ans — sont fortement représentées dans les communes de 2,000 à moins de 5,000 habitants; la moyenne générale est encore dépassée dans les communes de moins de 2,000 habitants et de 5,000 à moins de 20,000 habitants.

Pour ce qui concerne les catégories de 21 à moins de 65 ans, c'est dans le groupe de communes comptant 100,000 habitants et plus qu'apparaît la proportion la plus élevée; toutefois, les proportions sont également supérieures à la moyenne générale dans les groupes de communes comptant 20,000 à moins de 50,000 habi-

tants et 50,000 à moins de 100,000 habitants. Quant à la catégorie d'âges de 65 ans et plus, c'est dans le groupe de communes de 100,000 habitants et plus qu'elle se présente avec la plus forte proportion; mais les groupes de communes de moins de 2,000 habitants et de 50,000 à moins de 100,000 ressortent également avec une proportion supérieure à la moyenne générale.

Par rapport à 1930, les proportions des habitants de moins de 15 ans et de 15 à moins de 21 ans ont diminué dans tous les groupes de communes; celles de 21 à moins de 65 ans ont augmenté dans les deux groupes inférieurs et diminué dans les autres groupes; celles de 65 ans et plus se sont accrues dans des proportions importantes dans tous les groupes de communes.

On peut, enfin, se rendre compte, à l'aide du tableau 7, des différences dans la distribution par groupe de communes de la population de chaque groupe d'âges.

5. — Répartition de la population des régions linguistiques par groupe d'âges.

Dans ce qui suit, on a compté dans la région flamande, les provinces d'Anvers, Flandre orientale, Flandre occidentale et Limbourg ainsi que l'arrondissement de Louvain; la région wallonne comprend les provinces de Hainaut, Liège, Luxembourg et Namur et en plus l'arrondissement de Nivelles. L'arrondissement de Bruxelles est considéré séparément puisqu'en réalité les deux groupes linguistiques y sont largement représentés.

Le tableau 11 indique la répartition de la population des régions linguistiques par groupe d'âges et nationalité. De plus, on y a mentionné les proportions de chaque groupe d'âges dans le total de chaque région ainsi que la proportion que chacune des régions atteint dans chaque groupe d'âges.

Il va presque de soi que la région de langue flamande est la plus fortement représentée dans chaque groupe d'âges puisque la population totale de cette région dépasse 50 % de celle du Royaume. Elle intervient d'ailleurs pour plus de la moitié de la population dans les groupes d'âges de moins de 25 ans et de 30 à moins de 35 ans; pour plus de 40 % dans les autres groupes.

Si l'on considère maintenant les proportions de chaque groupe d'âges dans chaque région, on constate ce qui suit :

Région flamande.

Les groupes les plus denses sont classés par ordre d'importance comme suit :

| | |
|----------------------------|------|
| — de 5 ans | 86 ‰ |
| 15 à moins de 20 ans | 84 » |
| 20 à — de 25 ans | 82 » |

| 40 à — de 45 ans } | |
| 5 à — de 10 ans | 73 » |
| 25 à — de 30 ans | 70 » |

Les autres groupes comptent une proportion inférieure à 70 ‰. A partir du groupe 45 à 50 ans, cette proportion diminue d'ailleurs de façon continue. La proportion de toutes les personnes âgées de 65 ans et plus atteint 93 ‰.

Région wallonne.

Les groupes les plus denses sont les suivants :

| | |
|------------------------|------|
| 20 à — de 25 ans | 80 ‰ |
| 40 à — de 45 ans | 79 » |
| 45 à — de 50 ans | 78 » |
| 35 à — de 40 ans | 75 » |
| 25 à — de 30 ans | 73 » |
| 15 à — de 20 ans | 71 » |

Tous les autres groupes, y compris ceux inférieurs à 15 ans et de 30 à moins de 35 ans interviennent pour moins de 70 ‰.

Les groupes de 5 à moins de 10 ans et de 10 à moins de 15 ans atteignent seulement une proportion respectivement égale à 52 et 58 ‰, alors que ces chiffres sont dépassés par tous les groupes compris entre 50 et 65 ans. La proportion des personnes âgées de 65 ans et plus est de 123 ‰.

Arrondissement de Bruxelles.

Les groupes les plus denses sont, en les classant par ordre d'importance, les suivants :

| | |
|------------------------|--------|
| 40 à — de 45 ans | } 84 ‰ |
| 45 à — de 50 ans | |
| 35 à — de 40 ans | 82 » |
| 50 à — de 55 ans | 76 » |
| 20 à — de 25 ans | } 72 » |
| 25 à — de 30 ans | |

Tous les autres groupes atteignent moins de 70 ‰. Les groupes de 5 à moins de 10 ans et de 10 à moins de 15 ans comptent respectivement 50 et 55 ‰. Seuls les groupes d'habitants âgés de 65 ans et plus interviennent pour une proportion moindre. La proportion d'ensemble de ces derniers est 113 ‰.

On remarquera que plus de 12 % de la population wallonne est âgée de plus de 65 ans; si l'on s'en tenait uniquement aux Belges habitant la région wallonne, cette proportion atteindrait 12.9 %. Il est à remarquer, d'ailleurs, que la proportion des enfants de moins de 15 ans est, en Wallonie, plus élevée parmi les étrangers que parmi les Belges.

L'évolution des éléments ci-dessus depuis 1880 est donnée dans le tableau 13.

Le tableau 13^{bis} donne, à titre de comparaison, la répartition des habitants des trois régions linguistiques par groupe d'âges pour les quatre derniers recensements.

6. — Répartition de la population du Royaume par groupe d'âges et par nationalité.

On a recensé dans le Royaume 367,619 habitants de nationalité étrangère. La distribution de ces habitants par groupe d'âges figure au tableau 14.

Ce tableau permet de constater que les proportions relatives aux étrangers appartenant au groupe d'âges compris entre 20 et 45 ans sont supérieures à celles des Belges. Pour le groupe de moins de 5 ans, les proportions sont égales. Pour les autres groupes d'âges, elles sont inférieures. On a d'ailleurs compté parmi les Belges proportionnellement plus d'enfants (moins de 15 ans) et de vieillards (65 ans et plus) que parmi les étrangers. La proportion des adolescents et des adultes est plus élevée parmi les étrangers que parmi les Belges (tableau 15). Comparativement à 1930 — premier recensement pour lequel on dispose des éléments nécessaires — la répartition des étrangers par groupe d'âges a subi des modifications sensibles. C'est ainsi que la proportion des enfants a diminué de 11 ‰; il y a, par contre, une augmentation assez importante de la proportion des étrangers âgés de 20 à moins de 25 ans et de 35 ans à moins de 55 ans.

CHAPITRE II.

RÉPARTITION DE LA POPULATION PAR GROUPE D'ÂGES ET PAR SEXE.

1. — Répartition de la population totale par groupe d'âges et par sexe.

La population du Royaume se répartit par groupe d'âges et par sexe, comme il est indiqué au tableau 16.

Examinons d'abord séparément la distribution des habitants du sexe masculin et féminin.

a) *Habitants du sexe masculin.*

Le nombre le plus élevé d'hommes sont âgés de 20 à moins de 25 ans (83 ‰); ceux-ci sont donc nés durant les années 1923 à 1927 inclusivement; vient ensuite le groupe de 40 à moins de 45 ans avec 79 ‰.

Les groupes de moins de 5 ans et de 15 à moins de 20 ans ont pratiquement atteint le même chiffre, soit 78 ‰.

Il y a lieu de remarquer le nombre peu élevé d'hommes âgés de 5 à moins de 10 ans (64 ‰) et de 30 à moins de 35 ans (63 ‰). Pour le premier groupe, cette situation résulte du fait qu'il comprend les enfants nés durant les années 1938 à 1942 inclusivement, période durant laquelle les années 1940, 1941 et 1942 surtout apparaissent avec un coefficient de natalité réduit. La diminution du dernier groupe est due à la même cause; en effet, il s'agit ici de personnes nées au cours des années 1913 à 1917 inclusivement.

Si, pour les personnes du sexe masculin, on compare les chiffres absolus des deux derniers recensements (1930 et 1947), on constate qu'en 1947 le nombre d'habitants de moins de 10 ans et de 20 à moins de 35 ans a sensiblement dimi-

nué par rapport à 1930. Dans tous les autres groupes on enregistre une augmentation.

Si l'on compare les chiffres relatifs de 1947 à ceux de 1930, on arrive à la même constatation que pour les chiffres absolus, excepté en ce qui concerne le groupe de 15 à moins de 20 ans qui, proportionnellement, se situait plus bas en 1947 qu'en 1930.

Par rapport à 1910 on enregistre, en 1947, une diminution des pourcentages pour les moins de 35 ans. Dans les autres groupes, il y a une augmentation.

b) *Habitants du sexe féminin.*

Tout comme pour le sexe masculin, les habitants du sexe féminin, âgés de 20 à moins de 25 ans sont les plus nombreux; la proportion pour mille habitants est cependant moins élevée que parmi les hommes.

Le groupe de 40 à moins de 45 ans revêt à peu près la même importance que celui de 20 à moins de 25 ans et de ce fait apparaît avec les mêmes chiffres relatifs (77 ‰). Immédiatement après viennent les groupes de 15 à moins de 20 ans et de 45 à moins de 50 ans qui atteignent le même chiffre, soit 75 ‰.

Par rapport à 1930 on enregistre une régression (chiffres absolus et relatifs) dans les groupes de 0 à moins de 10 ans et de 15 à moins de 35 ans; dans les autres groupes il y a une augmentation.

Par rapport à 1910, le nombre de femmes a subi un mouvement de recul dans les groupes de moins de 20 ans et de 25 à moins de 35 ans;

dans les autres groupes on observe un accroissement; dans la répartition proportionnelle, il y a une diminution des chiffres concernant les habitants âgés de moins de 35 ans et augmentation pour les catégories d'âges plus élevés.

**

Si, pour le recensement de 1947, on compare les chiffres absolus des habitants du sexe mas-

culin à ceux des habitants du sexe féminin, on remarque que, pour les huit premiers groupes d'âges (de 0 à moins de 40 ans), le nombre des femmes est moins important que celui des hommes.

Pour tous les autres groupes, l'inverse se produit. Ce fait résulte :

1° du taux de masculinité des naissances : en effet, en règle générale, le nombre des naissances de garçons est plus élevé que celui des filles

et cet excédent du sexe masculin se maintient seulement dans les groupes d'âges jeunes;

2° de la plus grande longévité moyenne des femmes;

3° des deux guerres mondiales : durant ces années de guerre et surtout au cours des années 1914-1918 plus d'hommes que de femmes ont été tués.

Les chiffres relatifs révèlent une proportion

plus élevée chez les hommes jusqu'au groupe de 40 à moins de 45 ans.

En ce qui concerne le groupe de 45 à moins de 50 ans, les proportions sont sensiblement les mêmes, tandis que pour les groupes de 50 ans et plus les chiffres relatifs se situent plus haut pour les habitants du sexe féminin.

portionnelle du nombre d'habitants de chaque sexe et de chaque groupe d'âges par rapport à l'ensemble de la population.

La répartition donnée dans ce tableau est souvent figurée par un graphique que l'on appelle improprement pyramide des âges.

Nous donnons en annexe la pyramide des âges pour ce qui concerne les recensements de 1910, 1920, 1930 et 1947.

Les écarts entre ces graphiques font ressortir l'influence exercée par les deux guerres mondiales et par la régression de la natalité et de la mortalité sur la structure par âge de la population belge.

2. — Répartition de la population du Royaume par groupe d'âges, sexe et nationalité.

Le tableau 18 donne la répartition de la population du Royaume par sexe, groupe d'âges et suivant qu'il s'agit de Belges ou d'étrangers.

Nous constatons tout d'abord que la population de nationalité belge se répartit par sexe et par groupe d'âges à peu près de la même façon que la population totale : le nombre d'étrangers recensés dans le pays est trop peu important pour influencer, d'une façon sensible, la distri-

bution par groupe d'âges, de la population de chaque sexe.

Si l'on examine la répartition par groupe d'âges et par sexe des habitants de nationalité étrangère, on constate que la proportion des habitants âgés de 20 à moins de 50 ans est notablement plus élevée pour les hommes que pour les femmes; pour les autres groupes c'est l'inverse que l'on observe.

En comparant la distribution des Belges et des étrangers par sexe, on constate :

1° pour les hommes de nationalité étrangère : importance relative plus grande pour les groupes compris entre 20 et 45 ans; le même phénomène s'est produit en 1930 mais seulement pour les groupes jusque 40 ans; pour les autres groupes, les proportions sont moins élevées que pour les Belges;

2° pour les femmes de nationalité étrangère : importance relative plus grande pour les groupes de 0 à moins de 40 ans; pourcentages plus faibles pour les autres groupes.

Le tableau 19 donne l'importance proportionnelle de chaque sexe et de chaque groupe d'âges par rapport à l'ensemble de la population belge d'une part et à l'ensemble de la population étrangère d'autre part.

* H = Hommes, F = Femmes.

4. — Répartition de la population
des régions linguistiques
par groupe d'âges et sexe.

Le tableau 22 indique la répartition de la population des régions linguistiques flamande et wallonne et de l'arrondissement de Bruxelles par groupes d'âges et par sexe. Pour chaque sexe on donne les chiffres relatifs pour 1,000 habitants.

a) *Hommes.*

Pour les habitants du sexe masculin de moins de 20 ans, les proportions sont les plus élevées dans la région flamande; pour les groupes de 20 à moins de 30 ans et de 65 ans et plus, dans la région wallonne; pour ceux de 30 à moins de 65 ans, dans l'arrondissement de Bruxelles.

b) *Femmes.*

Les proportions relatives aux femmes sont le plus élevées dans la région flamande dans cinq groupes d'âges (de 0 à moins de 25 ans); dans la région wallonne dans les groupes d'âges de 65 ans et plus, et dans l'arrondissement de Bruxelles dans les huit groupes d'âges de 25 à moins de 65 ans.

5. — Nombre de femmes pour mille hommes.

Les tableaux 23 et 24 indiquent par groupe d'âges, dans chaque province et dans chaque groupe de communes, le nombre de femmes pour mille hommes.

Dans le paragraphe I nous avons déjà attiré l'attention précédemment sur le fait que dans les huit premiers groupes d'âges (de 0 à moins de 40 ans) le nombre de femmes est inférieur à celui des hommes.

Ceci a trait à l'ensemble du Royaume.

En ce qui concerne les provinces, les nombres de femmes pour mille hommes varient d'une province à l'autre, pour chaque groupe d'âges.

Le nombre d'habitants du sexe féminin est le plus élevé dans les groupes d'âges suivants :

Anvers : 20 ans et plus.

Brabant : 15 ans et plus.

Flandre occidentale : 15 à moins de 20 ans, 25 ans et plus.

Flandre orientale : 25 ans et plus.

Hainaut : 50 ans et plus.

Liège : 50 ans et plus.

Limbourg : 55 à moins de 60 ans, 80 ans et plus.

Luxembourg : 25 à moins de 30 ans, 45 ans et plus. (Pour le groupe de 40 à moins de 45 ans, le nombre d'hommes est sensiblement aussi élevé que celui des femmes.)

Namur : 45 ans et plus.

Cette hétérogénéité dans la distribution de la population des provinces par sexe est due, en premier lieu, à la situation économique de chacune d'elles; les provinces industrielles réclament de la main-d'œuvre masculine, tandis que dans les provinces contenant de grosses agglomérations urbaines, immigrer un grand nombre de femmes qui viennent y exercer des emplois domestiques.

Toutefois, les différences observées pour les provinces n'apparaissent pas aussi clairement lorsque l'on examine la répartition par sexe de la population des groupes de communes, ce qui n'était pas le cas lors du recensement de 1930.

En effet, le sexe féminin a la supériorité :

— pour les communes de moins de 20,000 habitants (donc les trois premiers groupes de

communes), dans les groupes d'âges de 45 ans et plus;

— pour les communes de 20,000 à moins de 50,000 habitants, dans les groupes de 15 à moins de 20 ans et de 35 ans et plus;

— pour les communes de 50,000 habitants et plus (donc les deux derniers groupes) dans les groupes d'âges de 15 ans et plus.

Pour l'année 1947 nous pouvons dire que plus la population des communes est élevée plus il y a de groupes d'âges où les habitants du sexe féminin prédominent.

En ce qui concerne les régions linguistiques, on constate que chaque région compte, en chiffres absolus, plus de femmes que d'hommes; proportionnellement, le nombre de femmes est le plus élevé dans l'arrondissement de Bruxelles comme le montrent les pourcentages suivants :

linguistique des hommes et des femmes se présente de la façon suivante :

Région flamande : les hommes prédominent dans les huit premiers groupes d'âges (de 0 à moins de 40 ans).

Région wallonne : les hommes sont en majorité dans les neuf premiers groupes d'âges (de 0 à moins de 45 ans).

Arrondissement de Bruxelles : ce n'est que dans les trois premiers groupes que les hommes sont les plus nombreux (de 0 à moins de 15 ans).

6. — Répartition des habitants de nationalité étrangère par nationalité et groupe d'âges.

Le tableau 25 donne la répartition des étrangers par nationalité et grands groupes d'âges. Dans le tableau 26, on a consigné la proportion des habitants de chaque nationalité par rapport au total des étrangers dans chaque groupe d'âges. Le tableau 27 donne la distribution proportionnelle par groupes d'âges des étrangers de chaque sexe, pour chaque nationalité.

Les nationalités pour lesquelles on a relevé un effectif de plus de 10 % sont dans chaque groupe d'âges, sans distinction de sexe, les suivantes :

a) pour les moins de 5 ans :

| | |
|----------------|-------|
| Pays-Bas | 21.07 |
| Italie | 18.50 |
| Pologne | 17.68 |
| France | 15.78 |

Total : 73.03

b) 5 à moins de 15 ans :

| | |
|----------------|-------|
| Pays-Bas | 23.02 |
| Italie | 20.82 |
| Pologne | 16.44 |
| France | 16.— |

Total : 76.28

c) 15 à moins de 20 ans :

| | |
|----------------|-------|
| Italie | 22.11 |
| Pays-Bas | 18.90 |
| Pologne | 17.76 |
| France | 17.34 |

Total : 76.11

d) 20 à moins de 65 ans :

| | |
|----------------|-------|
| Italie | 25.32 |
| France | 17.28 |
| Pologne | 16.44 |
| Pays-Bas | 14.61 |

Total : 73.65

e) 65 ans et plus :

| | |
|----------------|-------|
| France | 35.57 |
| Pays-Bas | 30.60 |

Total : 66.17

A titre de comparaison, nous faisons suivre ci-après le pourcentage que représente l'ensemble des habitants de chacune des quatre nationalités ci-dessus par rapport au total des étrangers :

| | |
|-----------------------------|---------|
| Total des Italiens | 22.89 % |
| Total des Français | 18.07 » |
| Total des Néerlandais | 17.33 » |
| Total des Polonais | 15.92 » |

Ensemble : 74.21 %

Les pourcentages par sexe correspondent à peu près aux proportions ci-dessus en ce qui concerne le total des hommes et des femmes. Il y a lieu toutefois de signaler que dans le groupe des habitants étrangers de 15 à moins de 20 ans, la proportion d'Italiens est plus élevée que celle des Italiennes (26.73 % contre 16.94 %); il en va de même pour le groupe de 20 à moins de 65 ans (31.78 % contre 13.92 %). Toutefois, dans ce dernier groupe, les Françaises atteignent un pourcentage beaucoup plus élevé que les Français (soit 24.79 % contre 13.04 %).

En considérant la répartition proportionnelle par groupes d'âges pour chaque nationalité (tableau 27), on constate que les proportions les plus élevées ont été relevées pour les nationalités suivantes :

Moins de 5 ans :

| | |
|---------------------------------------|-----------|
| garçons : Etats-Unis d'Amérique | (14.66 %) |
| filles : idem | (22.56 %) |
| garçons et filles : idem | (17.91 %) |

5 à moins de 15 ans :

| | |
|---|-----------|
| garçons : Autriche | (15.73 %) |
| filles : Yougoslavie | (21.62 %) |
| garçons et filles : Tchécoslovaquie ... | (17.20 %) |

15 à moins de 20 ans :

| | |
|----------------------------------|-----------|
| hommes : Espagne | (12.87 %) |
| femmes : Espagne | (19.09 %) |
| hommes et femmes : Espagne | (15.41 %) |

20 à moins de 65 ans :

| | |
|----------------------------------|-----------|
| hommes : U.R.S.S. | (81.66 %) |
| femmes : Hongrie | (69.32 %) |
| hommes et femmes : U.R.S.S. | (76.83 %) |

65 ans et plus :

| | |
|----------------------------------|-----------|
| hommes : Pays-Bas | (9.60 %) |
| femmes : Turquie | (15.27 %) |
| hommes et femmes : Turquie | (13.22 %) |

Si l'on compare la répartition proportionnelle par groupes d'âges de chaque nationalité, sans distinction de sexe, avec les proportions qu'on a relevées pour l'ensemble de la population du Royaume dans les mêmes groupes d'âges, on constate que pour les nationalités suivantes, la

e) dans le groupe de 65 ans et plus : pour la France et la Turquie.

7. — Age moyen et âge médian de la population.

On prend souvent comme mesure de la longévité de la population, l'âge moyen ou l'âge médian des habitants à l'époque des divers recensements. Ce sont là cependant des mesures assez imparfaites de l'indice que l'on veut établir. En effet, elles se basent sur la distribution par âge de la population; or, cette distribution est influencée, non seulement par la mortalité, mais également par la natalité; plus la mortalité est faible, plus l'âge moyen est élevé; plus la natalité est élevée, moins élevé est l'âge moyen des habitants.

Quoi qu'il en soit, nous donnons au tableau 28 les résultats du calcul de l'âge moyen des vivants lors des sept derniers recensements.

Tableau 28.

| ANNÉES | Age moyen de la | | | | | |

| Total : | 35 | — | 36 | 6 | 35 | 9 |

Si l'on fait abstraction de la légère régression relevée en 1890 par rapport à 1880, on constate que l'âge moyen n'a cessé d'augmenter d'un recensement au suivant. L'âge moyen des hommes est toujours moins élevé que celui des femmes; la plus grande différence entre ces deux âges s'observe en 1947.

Enfin, l'âge moyen des étrangers est moins élevé que celui des Belges; cette constatation est due uniquement à la présence parmi les étrangers d'une proportion plus élevée d'éléments appartenant à la population active.

Si l'on calcule l'âge moyen de la population totale dans chaque province on obtient le résultat suivant :

Tableau 29.

Le résultat du même calcul pour la population des deux régions linguistiques et de l'arrondissement de Bruxelles est consigné dans l'état suivant :

Tableau 30.

| Le Royaume : | 35 | — | 36 | 6 | 35 | 9 |

Les deux tableaux ci-dessus indiquent clairement que l'âge moyen de la population des provinces flamandes est le moins élevé; entre la province de Limbourg qui atteint de loin le chiffre le plus bas et la province de Liège où se relève le chiffre le plus élevé, il existe une diffé-

rence de 8 ans et 6 mois, ce qui est considérable.

L'arrondissement de Bruxelles considéré séparément atteint un chiffre encore supérieur à celui de la province de Liège.

L'âge médian de la population du Royaume pour chaque recensement depuis 1880, ainsi que l'âge correspondant aux quartiles de chaque distribution, est indiqué dans le tableau 31.

8. — Unités de consommation.

Les nombres-indices du coût de la vie sont pondérés au moyen de données rassemblées à l'occasion d'une enquête sur les budgets de familles d'ouvriers et d'employés.

« La composition des familles observées n'est pas uniforme; il en résulte qu'il est indispensable pour obtenir des résultats comparables entre eux, de réduire les consommations qui varient d'une famille à l'autre en une unité uniforme de mesure dite unité de consommation. Cette unité est appelée aussi « quet » en l'honneur du statisticien belge Quetelet. Cette mesure admise repose sur la convention suivante :

» si l'on prend pour unité l'enfant nouveau-né,
 » la puissance de consommation de l'individu
 » peut être considérée comme augmentant d'un
 » dixième par an, jusqu'à 25 ans pour l'homme
 » et 20 ans pour la femme. Un homme de plus
 » de 25 ans, par exemple, représente donc une
 » consommation de 3.5. D'après cette base, il est
 » facile d'évaluer la puissance de consommation
 » d'une famille composée de plusieurs membres
 » dont les âges sont connus et inversement, il est
 » possible de réduire à une unité moyenne de
 » consommation les dépenses et les quantités
 » figurant au budget d'une foule de familles de
 » compositions diverses » (1).

C'est donc à l'occasion des enquêtes budgétaires qu'est née l'idée d'unité de consommation. L'échelle des coefficients, dont il est question ci-dessus, a été proposée par le D^r Ernst Engel dans son travail intitulé : « Die Levenkosten Belgischer Arbeiterfamilien », paru dans le *Bulletin de l'Institut international de Statistique*, tome IX, premier livre, Rome 1895.

Dans les tableaux 32 et 33 on a calculé le nombre d'unités de consommation d'après les règles indiquées ci-dessus, pour ce qui concerne les habitants recensés dans le Royaume, lors des

sept derniers recensements, ainsi que pour la population des provinces et groupes de communes, lors du recensement de 1947.

On remarquera toutefois qu'un recensement n'indique pas le nombre d'habitants d'un âge donné, mais bien ceux d'un âge compris entre deux âges consécutifs.

Pour obtenir le nombre total d'unités de consommation, on a donc multiplié le nombre d'habitants de chaque âge par 1.05, 1.15 etc., jusqu'à 25 ans pour les hommes et 20 ans pour les femmes. Pour les autres âges, on a multiplié par

En ce qui concerne la comparaison avec les recensements antérieurs (tableau 32), on constatera que, quel que soit le sexe envisagé :

1. Le nombre moyen d'unités de consommation par habitant augmente d'un recensement au suivant.

2. L'accroissement du nombre d'unités de consommation a toujours été supérieur à celui de la population; ces constatations sont des con-

séquences directes du vieillissement de la population.

C'est également aux différences dans la natalité que l'on peut attribuer les divergences entre les proportions qui figurent dans le tableau relatif aux provinces et groupes de communes (tableau 33): les provinces et groupes de communes dans lesquels la natalité est le plus élevée, ressortent avec un nombre moyen d'unités de consommation par habitant inférieur à la moyenne du Royaume, tandis que leur importance dans l'ensemble des unités de consommation est inférieure à celle que leur population leur attribue.

9. — Comparaison des résultats
du recensement belge
avec ceux des recensements français et néerlandais.

Maintenant plus que jamais, il est intéressant de se rendre compte des différences existant entre la distribution par âge des habitants résidant en Belgique et celle des habitants recensés en France et aux Pays-Bas. C'est ce que permet le tableau 34.

Si nous comparons les chiffres relatifs relevés en Belgique à ceux obtenus pour la population française, nous constatons que les proportions des groupes d'âges suivants sont supérieures en Belgique aux proportions correspondantes en France : moins de 5 ans, 20 à moins de 30 ans, 45 à moins de 60 ans; elles ont la même impor-

tance dans le groupe d'âges de 40 à moins de 45 ans et elles sont inférieures dans les autres groupes. Dans les deux pays, plus de 10 pour cent des habitants sont âgés de 65 ans et plus.

Si nous établissons une comparaison avec les chiffres relevés aux Pays-Bas, nous remarquons que les proportions des habitants de moins de 35 ans sont notablement plus élevées aux Pays-Bas qu'en Belgique. C'est surtout pour les âges les moins avancés qu'on enregistre aux Pays-Bas des proportions élevées : le groupe des moins de 5 ans dépasse même la proportion relevée en Belgique pour les personnes de 65 ans et plus.

Pour les groupes d'âges de 35 ans et plus, toutes les proportions sont plus élevées en Belgique qu'aux Pays-Bas.

DEUXIÈME PARTIE

**RÉPARTITION DE LA POPULATION
PAR SEXE, AGE ET ÉTAT CIVIL**

Introduction.

La répartition de la population par état civil a été étudiée dans le tome IV. Pour pousser plus loin cette étude, il convient d'examiner la répartition par état civil combinée avec l'âge.

1. — Répartition de la population par sexe, état civil et groupe d'âges.

Le tableau 35 donne la répartition de la population totale par état civil, sexe et groupe d'âges lors des sept derniers recensements. Le tableau 36 mentionne la proportion des habitants de chaque groupe d'âges dans l'ensemble des habitants de chaque sexe et de chaque état civil.

L'examen des données contenues dans ces tableaux permet de faire les constatations suivantes :

a) *Chiffres absolus.*

1° HOMMES CÉLIBATAIRES.

Diminution pour ce qui concerne 1947 du nombre des célibataires d'un groupe d'âges au suivant. Par rapport à 1930, régression du nombre de célibataires dans les groupes d'âges inférieurs à 15 ans, de 20 à moins de 35 ans et de 50 à moins de 65 ans; augmentation dans les autres groupes.

2° FEMMES CÉLIBATAIRES.

En 1947, diminution du nombre de célibataires d'un groupe d'âges au suivant.

On remarque que le nombre de femmes célibataires est inférieur à celui des hommes célibataires pour tous les âges de moins de 45 ans: l'inverse se présente à partir de 45 ans.

Par rapport à 1930, il y a régression pour les femmes célibataires dans tous les groupes d'âges inférieurs à 55 ans; augmentation dans les autres groupes.

3° MARIÉS ET MARIÉES.

Le groupe le plus important est celui de 40 à moins de 45 ans (553,870 mariés et mariées). Par rapport à 1930, le nombre de mariés et mariées s'est accru dans presque tous les groupes; seuls ceux de 25 à moins de 30 ans et de 30 à moins de 35 ans font exception. C'est l'âge des personnes nées au cours des années 1913 à 1922.

4° VEUFS.

Le nombre de veufs en 1947 augmente avec l'âge pour atteindre son maximum pour le groupe de 70 à moins de 75 ans (33,351). On constate une régression par rapport à 1930 du nombre de veufs âgés de moins de 65 ans et une augmentation dans les autres groupes d'âges.

5° VEUVES.

Même remarque que pour les hommes en ce qui concerne 1947. Le nombre de veuves a diminué dans les groupes d'âges inférieurs à 25 ans par rapport au recensement précédent; il s'est accru dans les autres groupes.

En 1947, le nombre de veuves est pratiquement le triple de celui des veufs pour les âges inférieurs à 60 ans; à partir de 60 ans, le nombre de veuves atteint plus que le double de celui des veufs.

6° DIVORCÉS ET DIVORCÉES.

Le nombre de divorcés augmente en 1947 d'un groupe d'âges au suivant jusqu'au groupe de 40 à moins de 45 ans; nous constatons le même phénomène pour les divorcées. Le nombre de divorcées est en outre sensiblement plus élevé dans tous les groupes d'âges que celui des divorcés.

Par rapport à 1930, on constate un sensible accroissement du nombre de divorcés des deux sexes dans tous les groupes d'âges; dans plusieurs d'entre eux, il est plus que le double de 1930.

Dans le tableau 37, on a indiqué pour chaque sexe la date du recensement où comparativement aux recensements qui se sont succédés depuis 1880 le nombre le plus élevé d'habitants de chaque état civil a été relevé pour chacun des groupes

pes d'âges envisagés. On peut en déduire que seul pour les divorcés les chiffres les plus élevés sont atteints en 1947 dans tous les groupes d'âges et pour les deux sexes.

* H = Hommes, F = Femmes.

n'a pas été effectué de recensement des âges en 1920 dans les communes des cantons d'Eupen, Malmédy et Saint-Vith.

b) Chiffres relatifs.

En ce qui concerne les célibataires, on constate une diminution (tableau 36) d'un groupe d'âges au suivant tant pour les hommes que pour les femmes. Pour les hommes mariés, la proportion augmente jusqu'au groupe de 40 à moins de 45 ans; pour les mariées, le même groupe d'âges donne la proportion la plus élevée; il y a cependant une faible régression pour le groupe de 30 à moins de 35 ans.

Pour les veufs, on relève un accroissement continu dans la proportion jusqu'au groupe de 70 à moins de 75 ans tant pour les hommes que pour les femmes. Pour les divorcés, la proportion augmente jusque 45 ans pour les deux sexes.

En 1947, le nombre d'hommes célibataires de moins de 30 ans atteint 85.98 % du total des hommes célibataires, tandis qu'il est de 82.91 % pour les femmes célibataires du même âge. En 1930, ces pourcentages étaient respectivement de 87.15 % pour les hommes et de 83.13 % pour les femmes.

71.59 % des hommes mariés ont, en 1947, entre 20 et 50 ans contre 76.26 % en 1930; 75.57 % des mariées ont un âge compris entre ces limites; ce pourcentage s'élève à 79.85 en 1930. Plus de la moitié des veufs et des veuves sont âgés de 55 à moins de 75 ans (respectivement 53.23 et 54.54 %). Le même phénomène a été constaté en 1930.

2. — Proportion des habitants de chaque état civil dans chaque groupe d'âges.

Dans le tableau 38 on a indiqué la proportion des habitants de chaque état civil dans le total de la population de chaque groupe d'âges et pour les sept derniers recensements.

Pour ce qui concerne les célibataires, la proportion pourcent la plus élevée se constate forcément dans le groupe des personnes âgées de 15 à moins de 20 ans. Il y a cependant une différence notable entre la proportion des hommes et celle des femmes (respectivement 99.29 % et 95.40 %). Il y a encore lieu d'ajouter que ces proportions sont les moins élevées de la période considérée.

Pour ce qui concerne les mariés, la proportion pourcent la plus élevée se constate, en 1947, dans le groupe des personnes âgées de 50 à moins de 55 ans pour les hommes et de 35 à moins de 40 ans pour les femmes. Lors du recensement de 1930, ces maxima étaient atteints respectivement dans les groupes de 40 à moins de 45 ans pour les hommes et dans le même groupe qu'en 1947 (35 à moins de 40 ans) pour les femmes.

Quant aux veufs et veuves, la proportion la plus élevée est enregistrée, en 1947, dans le groupe d'âges de 90 à moins de 95 ans, tant pour les hommes que pour les femmes.

Pour les divorcés, on constate les pourcentages les plus élevés dans les groupes d'âges de 40 à moins de 45 ans pour les hommes et de 35 à moins de 40 ans pour les femmes.

En comparant, pour chaque état civil, les proportions de 1947 à celle de 1930, nous constatons que les pourcentages des hommes célibataires se sont accrus pour les quatre groupes d'âges de 25 à moins de 45 ans et pour le groupe des personnes les plus âgées, c'est-à-dire de 95 à moins de 100 ans; ils ont diminué dans tous les autres groupes. Pour ces derniers, les proportions obtenues sont les plus basses que l'on ait enregistrées depuis 1880. Par rapport à 1930,

nous constatons pour les femmes célibataires une régression de la proportion jusqu'au groupe de 80 à moins de 85 ans. Pour ce qui concerne les données depuis 1880, on peut faire la même remarque pour les hommes.

Voici les différences qu'il y a, au point de vue de l'importance relative du groupe des célibataires (hommes et femmes) au cours des années 1880 et 1947 d'un part et des années 1930 et 1947 d'autre part.

Comparativement à 1880, le nombre proportionnel des célibataires a donc diminué à tous les âges. Cette diminution est surtout marquée parmi les jeunes générations et atteint son maximum dans le groupe de 25 à moins de 30 ans.

Comparativement à 1930, le nombre proportionnel des célibataires a également diminué pour tous les groupes d'âges. Cette régression atteint cependant son maximum dans le groupe de 50 à moins de 55 ans (2.56 %) mais reste néanmoins très marqué pour le premier groupe d'âges relevé (2.48 %).

Pour les hommes mariés, on relève une diminution de la proportion, par rapport à 1930, dans les quatre groupes de 25 à moins de 45 ans; dans tous les autres groupes il y a une augmentation. Pour les femmes mariées, on relève un accroissement du pourcentage dans tous les groupes.

Il résulte des constatations précédentes que les mariages deviennent toujours plus nombreux et qu'on se marie plus jeune qu'auparavant.

La proportion des veufs a diminué, par rapport à 1930, dans les groupes inférieurs à 85 ans; pour les veuves, l'on observe une tendance semblable sans que celle-ci ait la même régularité. Les proportions des veufs de moins de 85 ans sont les plus faibles qu'on ait constatées depuis 1880.

3. — Population mariable.

On désigne sous le nom de « population mariable », pour les hommes, l'ensemble des garçons, veufs et divorcés âgés de 18 ans et plus; pour les femmes, le total des filles, des veuves et des divorcées âgées de 15 ans et plus.

Le tableau 40 permet de calculer la population mariable lors de chacun des recensements qui se sont succédé depuis 1880. Il en résulte que la population mariable s'est élevée lors des sept derniers recensements aux chiffres et proportions suivants :

Tableau 41. — POPULATION MARIABLE BRUTE.

| 1947 | 990,028 | 23.57 | 1,333,731 | 30,93 |

Le nombre d'hommes mariables, en 1947, atteignait le chiffre de 990,028, celui des femmes 1,333,731, soit une différence de 343,703 unités en faveur des femmes. Cela tient, d'une part, à

la longévité plus grande des femmes, d'autre part, à ce que l'on compte trois générations en plus parmi les femmes que parmi les hommes : on compte les femmes à partir de 15 ans et les hommes à partir de 18 ans. La différence en 1930 n'était que de 288,138 unités. On constatera de plus, tant pour les femmes que pour les hommes, et exception faite pour l'année 1920, que la proportion pour 100 habitants de la population mariable diminue depuis 1890 et atteint pour les femmes le pourcentage le plus bas constaté jusqu'à présent.

Le nombre de mariages étant insignifiant parmi les femmes âgées de 15 à moins de 18 ans et parmi les habitants âgés de 60 ans et plus, on obtient une meilleure comparaison des nombres de personnes mariables en ne considérant que les personnes âgées de 18 ans à moins de 60 ans (population mariable que nous désignons par population mariable nette).

On obtient ainsi les chiffres suivants :

Tableau 42. — POPULATION MARIABLE NETTE.

On remarquera que lorsqu'on limite la population mariable aux âges désignés ci-dessus, le nombre des hommes est toujours supérieur à

celui des femmes, excepté toutefois pour le recensement de 1920.

De même, l'importance relative de la population mariable ci-dessus par rapport à l'ensemble de la population masculine et féminine a, pour tous les recensements, été supérieure pour les hommes que pour les femmes.

Sauf pour 1920, cette proportion diminue dans chaque sexe d'un recensement au suivant depuis 1890.

4. — Répartition de la population des provinces par groupe d'âges, sexe et état civil.

Le tableau 44 donne pour chacune des provinces la répartition des habitants par sexe, état civil et groupe d'âges.

Le tableau 45 mentionne séparément, pour chaque groupe d'âges, la répartition proportionnelle par état civil des habitants de chaque sexe.

Ce tableau fait apparaître que l'importance relative de chaque état civil diffère parfois considérablement dans les diverses provinces. Il est naturel que ces différences sont plus grandes dans les premiers groupes d'âges que dans les âges supérieurs.

Pour ce qui concerne le premier groupe (15 à moins de 20 ans), c'est la précocité plus ou moins grande des mariages qui détermine les écarts, de province en province, dans les pourcentages des mariés. Le groupe d'âges de 20 à moins de 25 ans compte en moyenne 21.83 de mariés du sexe masculin et 43.26 mariés du sexe féminin. Ces pourcentages sont plus élevés que ceux obtenus lors du recensement de 1930 (respectivement 19.80 et 40.23).

Dans ce même groupe, les pourcentages extrêmes apparaissent dans les provinces de Luxembourg et de Hainaut, respectivement 13.06 et 29.37 pour les hommes et 34.10 et 58.56 pour les femmes.

Le groupe de 25 à moins de 30 ans révèle

également de grands écarts. Les moyennes générales sont : 60.54 pour les hommes mariés et 73.49 pour les femmes mariées. Les proportions extrêmes apparaissent dans les provinces de Luxembourg et de Brabant pour les hommes (respectivement 46.65 et 65.47) et dans les provinces de Luxembourg et de Hainaut pour les femmes (respectivement 66.12 et 81.13).

Les provinces se classent comme suit d'après les résultats obtenus pour ces deux groupes d'âges :

Dans le groupe de 20 à moins de 25 ans, quatre provinces pour ce qui concerne les hommes et trois provinces pour ce qui regarde les femmes ont un taux de mariés supérieur à la moyenne du pays (respectivement 21.83 et 43.26); les autres sont en dessous de cette moyenne. Entre les proportions extrêmes, il y a une différence de 16.31 unités pour les hommes et 24.46 unités pour les femmes.

Dans le groupe de 25 à moins de 30 ans, quatre provinces pour ce qui concerne les hommes et trois provinces pour ce qui regarde les

femmes ont également des proportions supérieures à la moyenne du pays (respectivement 60.54 et 73.49); les autres provinces ont un taux en dessous de la moyenne du Royaume. Entre les proportions extrêmes, il y a une différence de 18.82 unités pour les hommes et 15.01 unités pour les femmes. La différence pour les hommes est supérieure à celle constatée dans le groupe précédent (20 à moins de 25 ans). La différence pour les femmes est plus petite.

Dans les groupes supérieurs à 30 ans, la différence entre les provinces n'est plus aussi grande, parce que la fréquence des mariages devient moins inégale. Pourtant, il y a encore des écarts sensibles entre les extrêmes, ainsi qu'il ressort du classement contenu dans le tableau 46, qui concerne les groupes compris entre 30 et 50 ans.

Il y a lieu d'observer que le classement des provinces diffère d'un groupe d'âges à l'autre et même pour chaque sexe. Il est à remarquer que la province du Hainaut a chaque fois la propor-

tion la plus élevée de femmes mariées comme dans les deux groupes examinés ci-dessus et que, en ce qui concerne les mêmes groupes, le Luxembourg occupe partout la dernière place, tant pour les hommes que pour les femmes. Dans cette dernière province, par contre, la proportion des hommes et des femmes célibataires est la plus élevée dans tous les groupes d'âges.

Les différences entre les extrêmes sont mentionnées dans le petit tableau ci-dessous, qui relève également aux fins de comparaison les différences constatées plus haut pour les groupes d'âges de 20 à moins de 25 et de 25 à moins de 30 ans.

5. — Population mariable des provinces.

Le tableau 43 permet de calculer la population mariable dans chaque province.

Pour ce qui concerne la population mariable brute (y compris les habitants non mariés âgés de 60 ans et plus et les femmes non mariées de 15 à 18 ans), les chiffres s'établissent comme il est indiqué au tableau 47, qui relève aussi bien les chiffres absolus que les chiffres proportionnels à la population totale. Pour ce qui regarde les pourcentages, les provinces se classent dans l'ordre décroissant suivant :

| <i>Hommes.</i> | | <i>Femmes.</i> | |
|-----------------------|-------|-----------------------|-------|
| Luxembourg | 28.55 | Luxembourg | 34.95 |
| Limbourg | 26.90 | Liège | 33.22 |
| Liège | 26.08 | Brabant | 32.92 |
| Hainaut | 24.25 | Namur | 32.43 |
| Namur | 24.08 | Flandre occidentale.. | 30.65 |
| Flandre orientale ... | 23.30 | Flandre orientale ... | 30.25 |
| Flandre occidentale.. | 22.75 | Limbourg | 29.13 |
| Brabant | 22.13 | Hainaut | 28.97 |
| Anvers | 21.67 | Anvers | 28.61 |

Les proportions les plus élevées pour les deux sexes ont été relevées dans le Luxembourg; les

En ce qui concerne la population mariable nette (non compris les habitants non mariés âgés de 15 à moins de 18 ans et de 60 ans et plus), celle-ci s'établit, par province, comme il est indiqué au tableau 48.

En classant les provinces d'après leur importance (chiffres proportionnels), on obtient l'ordre suivant :

| <i>Hommes.</i> | | <i>Femmes.</i> | |
|------------------------|-------|------------------------|-------|
| Limbourg | 23.23 | Luxembourg | 20.01 |
| Luxembourg | 22.39 | Brabant | 18.60 |
| Liège | 20.97 | Liège | 18.08 |
| Hainaut | 19.11 | Flandre occidentale... | 17.84 |
| Namur | 18.59 | Limbourg | 17.79 |
| Flandre occidentale... | 18.41 | Flandre orientale ... | 17.25 |
| Flandre orientale ... | 18.36 | Namur | 16.74 |
| Brabant | 17.78 | Anvers | 16.73 |
| Anvers | 17.75 | Hainaut | 14.30 |

Les proportions les plus élevées se rencontrent dans la province de Limbourg pour les hommes et dans la province de Luxembourg pour les femmes. Quatre provinces pour ce qui

regarde les hommes et cinq provinces pour ce qui concerne les femmes ont une proportion plus élevée que la moyenne du Royaume. Quant aux pourcentages des hommes comparés à ceux des femmes, on constate que les proportions de ces dernières sont inférieures à celles des hommes, à l'inverse de ce qu'on a vu pour la population mariable brute. Pour le calcul de la population mariable nette, on a compté, en effet, trois générations en moins pour les femmes (15, 16 et 17 ans).

6. — Répartition des habitants des groupes de communes par groupe d'âges et état civil.

Le tableau 49 donne la répartition des habitants des groupes de communes par catégorie d'âges, sexe et état civil.

On en déduit les chiffres absolus et proportions indiquées au tableau 50 pour ce qui concerne la population mariable de 18 ans et plus

DE COMMUNES, SEXE, CATÉGORIE D'ÂGES ET ÉTAT CIVIL.

et de 15 ans et plus, selon qu'il s'agit de la population masculine ou féminine.

En ce qui concerne les hommes, la proportion diminue d'un groupe de communes à l'autre en partant des plus petites communes, excepté pour le dernier groupe de 100,000 habitants et plus.

Pour ce qui regarde les femmes, on ne relève

aucune tendance dans les proportions. Les groupes de 20,000 à moins de 50,000 habitants et de 100,000 habitants et plus apparaissent avec une proportion plus élevée. Quant à la population mariable nette, elle s'établit comme l'indique le tableau 51. Les proportions font apparaître le même mouvement que celui dont il vient d'être question.

7. — Répartition des habitants par sexe, nationalité, groupe d'âges et état civil.

Dans le tableau 52, nous avons indiqué pour ce qui concerne les Belges d'une part, les étrangers d'autre part, les éléments contenus dans les tableaux 44 et 45, publiés plus haut.

La comparaison des chiffres relatifs, qui figurent dans ce tableau, fournit les indications suivantes :

A. — Répartition des habitants de chaque état civil par groupe d'âges.

a) Si l'on considère la répartition des célibataires du sexe masculin par groupes d'âges, on remarque que la proportion est plus élevée pour les étrangers que pour les Belges dans les groupes d'âges compris entre 20 à moins de 55 ans; dans les autres groupes, c'est l'inverse que l'on constate.

b) Pour les célibataires du sexe féminin, les proportions sont, pour les étrangers, inférieures à celles que l'on relève parmi les Belges jusqu'à moins de 25 ans, elles sont égales pour les groupes de 55 à moins de 60 ans et de 90 ans et plus; supérieures pour les autres groupes.

c) *Mariés* : on remarque des proportions supérieures parmi les étrangers de 20 à moins de 45 ans, égales pour les groupes de 15 à moins de 20 ans, de 45 à moins de 50 ans et de 85 ans et plus, inférieures pour les autres groupes d'âges. La proportion la plus élevée pour les mariés de nationalité belge est atteinte dans le groupe de 40 à moins de 45 ans; pour les mariés de nationalité étrangère, dans le groupe de 35 à moins de 40 ans.

d) *Mariées* : proportions supérieures parmi les étrangères jusqu'à moins de 45 ans, inférieures pour les groupes d'âges supérieurs; les fréquences maxima parmi les mariées de nationalité belge et étrangère apparaissent dans les mêmes groupes que pour les hommes.

On peut cependant remarquer que, tant pour les femmes que pour les hommes, le maximum est plus élevé pour les étrangers que pour les Belges.

e) Les chiffres se rapportant aux veufs, veuves, divorcés et divorcées de nationalité étrangère sont trop faibles pour permettre d'en déduire des constatations de quelque valeur.

B. — Proportion pour cent des habitants de chaque état civil dans chaque groupe d'âges.

Pour ce qui concerne les étrangers, on remarque que c'est parmi ceux âgés de 50 à moins de 55 ans que l'on relève la plus forte proportion des hommes mariés. Pour les mariées, la plus forte proportion se constate dans le groupe de

40 à moins de 45 ans. Pour les hommes mariés de nationalité belge, c'est dans le groupe d'âges de 50 à moins de 55 ans que ce maximum est atteint; pour les mariées, ce mode se relève dans le groupe de 35 à moins de 40 ans.

Enfin, la proportion des célibataires du sexe masculin est plus élevée dans tous les groupes d'âges parmi les étrangers que parmi les Belges.

La proportion des étrangères célibataires est supérieure à celle des femmes belges célibataires dans tous les groupes d'âges supérieurs à 25 ans. Pour les mariés, les proportions des étrangers sont inférieures à celles des Belges de 20 à moins de 75 ans pour les hommes et de 25 à moins de 90 ans pour les femmes.

C. — Population mariable.

Si nous nous rapportons au tableau 49, on remarquera que la population mariable brute (hommes célibataires, veufs et divorcés âgés de 18 ans et plus, femmes célibataires, veuves et divorcées âgés de 15 ans et plus) atteint les proportions suivantes dans la population de chaque sexe et nationalité :

| | Hommes | Femmes |
|-----------------|--------|--------|
| Belges | 22.84 | 23.08 |
| Etrangers | 36.90 | 35.60 |

Si l'on envisage la population mariable nette (hommes et femmes célibataires, veufs et divorcés âgés de 18 à moins de 60 ans), on a les pourcentages suivants :

| | Hommes | Femmes |
|-----------------|--------|--------|
| Belges | 18.08 | 17.09 |
| Etrangers | 34.75 | 22.74 |

La proportion de la population mariable, tant nette que brute, est sensiblement plus élevée parmi les étrangers que parmi les Belges.
